

Project #1 Plan

Matt Campbell

<— — Sketch of visual design

Description

I will be designing an application that will be based around the participants mood and interest in music. An individual will be able to pick their current mood or emotion and this will recommend what kind of music genre to listen to.

There will be icons/words listed on the top area of the application that will be clickable &/or selectable. Based on what the participant selects there will be text that appears on the bottom of the application. The text that appears will provide genres of music that are recommended for listening enjoyment. This association will help the user decide what to listen when they are drawing a blank or just don't have an idea of what to choose.

I really enjoy using applications that are simplistic and don't have any distractions. That being said I want to use a three color pallet that will be engaging to the user. I also want the mood/emotions to be creative yet informal designs that are easily understood with out any questions. I believe this will be a nice beginning stage for project #1 that will allow expansion if I choose to continue with it in project #2.
